Attachments: ATT537464.txt

hello -

You should all have just gotten an e-mail from me listing your group for the urban ecosystem group project. If you did not, please contact me.

We will talk about the project at the end of class Wednesday or, if we run out of time, on Thursday. Go through the syllabus and web page and refresh your memory.

You will first need to determine your sites. See the guidelines and discuss it with your group. You will need to write this up in a brief proposal to us, letting us know the sites you have chosen, what they are like, and what you expect from the sites.

Also, you should choose which plants and animals you want to do your natural history report on - you have several to choose from and if you want to choose one not on the list but in urban areas in western Washington, let us know.

So far, crows, raccoons, shaggy lepiota, honey bee, red osier dogwood, sidewalk moss, Stellar's jays, common flickers, and common horsetail have been chosen. Cross those off your lists and let me know what you want before all the good ones are gone!

Be ready for the cold on Wednesday!

Sarah
